

# Data Modeling

FinTech  
Lesson 7.3

# Project 1 Slide Deck Project 1 Requirements

# A reminder about free tutoring

---

- Reminder that tutoring is available for free
- 1 hour per week session
  - Class materials
  - Homework
  - Tool / Software installation help
- Please reach out to TAs or Class Instructor to set up tutoring hour

# Class Objectives

---

By the end of today's class, you will be able to:

Apply data modeling techniques to database design.

Normalize data.

Identify data relationships.

Create visual representations of a database through entity relationship diagrams.

# Data Normalization

**Data normalization** is the process of restructuring data to a set of defined “normal forms.”

The process of data normalization **eliminates data redundancy and inconsistencies.**

# Data Normalization

---

The process of restructuring data to a set of defined “normal forms.”

Reduces and eliminates data redundancy and inconsistencies.

Three most common forms:

First normal form (1NF)

Second normal form (2NF)

Third normal form (3NF)

There are even more levels!

# First Normal Form (1NF)

Each field in a table row should contain a single value

Each row is unique

- Rows can have fields that repeat
- Whole rows do not fully match

## Raw Data

| family | children             |
|--------|----------------------|
| Smith  | Chris, Abby, Susy    |
| Jones  | Steve, Mary, Dillion |

## Normalization

## First Normal Form

| family | children |
|--------|----------|
| Smith  | Abby     |
| Smith  | Susy     |
| Jones  | Mary     |
| Smith  | Chris    |
| Jones  | Dillion  |
| Jones  | Mary     |

# Second Normal Form (2NF)

Data must be in first normal form

Single column primary key

- Primary key
- Identifies the table and row uniquely

Generally, there could be a need to create a new table

Data in 1NF

| family | children |
|--------|----------|
| Smith  | Abby     |
| Smith  | Susy     |
| Jones  | Mary     |
| Smith  | Chris    |
| Jones  | Dillion  |
| Jones  | Mary     |

2NF Normalization

Family Table

| family_id | family |
|-----------|--------|
| 1         | Smith  |
| 2         | Jones  |

Child Table

| child_id | family_id | children |
|----------|-----------|----------|
| 11       | 1         | Chris    |
| 22       | 1         | Abby     |
| 33       | 1         | Susy     |
| 44       | 2         | Steve    |
| 55       | 2         | Mary     |
| 66       | 2         | Dillion  |

**Transitive dependency** is a column value's reliance on another column through a third column.

# Transitive Dependency

|             |  |
|-------------|--|
| Transitive  | If $X > Y$ and $Y > Z$ , then $X > Z$ .  |
| Dependency  | <ul style="list-style-type: none"><li>• One value relies on another.</li><li>• Examples: city relies on postal code; age relies on birthday.</li></ul>   |
| For example | <ul style="list-style-type: none"><li>• Say you have three columns: <code>StoreName</code>, <code>OwnerAddress</code>, <code>OwnerName</code>.</li><li>• <code>OwnerName</code> and <code>OwnerAddress</code> rely on <code>StoreName</code>.</li><li>• <code>OwnerAddress</code> also depends on <code>OwnerName</code>.</li><li>• Therefore, <code>OwnerAddress</code> is transitively dependent on <code>StoreName</code> through <code>OwnerName</code>.</li></ul> |

# Third Normal Form (3NF)

Must be in second normal form

Contains non-transitively dependent columns

| owner_id | owner_name | owner_address    | store_name      |
|----------|------------|------------------|-----------------|
| 11       | Marshall   | 123, Fake Street | Soups and Stuff |
| 22       | Susan      | 44, New Drive    | Sink Emporium   |
| 33       | Molly      | 99, Old Lane     | Tasty Burgers   |

## 3NF Normalization

| owner_id | owner_name | owner_address    |
|----------|------------|------------------|
| 11       | Marshall   | 123, Fake Street |
| 22       | Susan      | 44, New Drive    |
| 33       | Molly      | 99, Old Lane     |

| store_id | store_name      | Owner_id (fk) |
|----------|-----------------|---------------|
| 1        | Soups and Stuff | 11            |
| 2        | Sink Emporium   | 22            |
| 3        | Tasty Burgers   | 33            |

## **Activity:** Employee Normalizer

In this activity, you will practice data normalization skills using the provided data.

**Suggested Time:**  
15 minutes

**Time's Up!** Let's Review.

# Foreign Keys

# Foreign Keys

Foreign keys reference the primary key of another table.

Can have a different name

Do not need to be unique

Primary Key

| family_id | family |
|-----------|--------|
| 1         | Smith  |
| 2         | Jones  |

Primary Key

Foreign Key

| child_id | family_id | children |
|----------|-----------|----------|
| 11       | 1         | Chris    |
| 22       | 1         | Abby     |
| 33       | 1         | Susy     |
| 44       | 2         | Steve    |
| 55       | 2         | Mary     |
| 66       | 2         | Dillion  |

## **Activity:** Foreign Keys

In this activity, you will create tables with foreign keys.

**Suggested Time:**  
15 minutes

**Time's Up!** Let's Review.

# Data Relationships

# Data Relationships

---

There are various data modeling relationships one table can have with another:

01

**One-to-One**

02

**One-to-Many**

03

**Many-to-Many**

# One-to-One Relationship

| ID | Name   | Social Insurance Number |
|----|--------|-------------------------|
| 1  | Homer  | 111111111               |
| 2  | Marge  | 222222222               |
| 3  | Lisa   | 333333333               |
| 4  | Bart   | 444444444               |
| 5  | Maggie | 555555555               |

Each item in one column is linked to only one other item from the other column.

Here, each person in the Simpson family can have only one Social Insurance Number.

Each Social Insurance Number can be assigned to only one person.

# One-to-Many Relationship

| ID | Address               |  | ID | Name     | Social Security | AddressID |
|----|-----------------------|--|----|----------|-----------------|-----------|
| 11 | 742 Evergreen Terrace |  | 1  | Homer    | 111111111       | 11        |
| 12 | 221B Baker Street     |  | 2  | Marge    | 222222222       | 11        |
|    |                       |  | 3  | Lisa     | 333333333       | 11        |
|    |                       |  | 4  | Bart     | 444444444       | 11        |
|    |                       |  | 5  | Maggie   | 555555555       | 11        |
|    |                       |  | 6  | Sherlock | 112233445       | 12        |
|    |                       |  | 7  | Watson   | 223344556       | 12        |

Two tables: one for people, another for addresses.

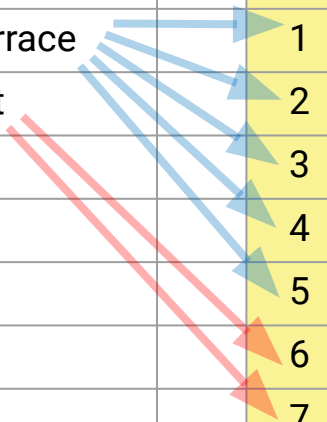

Each person has only one address.

But, each address can be associated with multiple people.

# One-to-Many Relationship

| ID | Address               |  | ID | Name     | Social Security | AddressID |
|----|-----------------------|--|----|----------|-----------------|-----------|
| 11 | 742 Evergreen Terrace |  | 1  | Homer    | 111111111       | 11        |
| 12 | 221B Baker Street     |  | 2  | Marge    | 222222222       | 11        |
|    |                       |  | 3  | Lisa     | 333333333       | 11        |
|    |                       |  | 4  | Bart     | 444444444       | 11        |
|    |                       |  | 5  | Maggie   | 555555555       | 11        |
|    |                       |  | 6  | Sherlock | 112233445       | 12        |
|    |                       |  | 7  | Watson   | 223344556       | 12        |

The two tables, joined, would look like the one above.

Each person has an address.

Each address can be associated with multiple people.

# Many-to-Many Relationship

---

| ID | Child  |  | ID | Parent |
|----|--------|--|----|--------|
| 1  | Bart   |  | 11 | Homer  |
| 2  | Lisa   |  | 12 | Marge  |
| 3  | Maggie |  |    |        |

Each child can have more than one parent.

Each parent can have more than one child.

# Many-to-Many Relationship

| ChildID | Child  | ParentID | Parent |
|---------|--------|----------|--------|
| 1       | Bart   | 11       | Homer  |
| 1       | Bart   | 12       | Marge  |
| 2       | Lisa   | 11       | Homer  |
| 2       | Lisa   | 12       | Marge  |
| 3       | Maggie | 11       | Homer  |
| 3       | Maggie | 12       | Marge  |

Each child can have more than one parent.

Each parent can have more than one child.

The two tables are joined in a **junction table**.

# Junction Table

The junction table contains many parent\_ids and many child\_ids.

|   | parent_id integer | child_id integer |
|---|-------------------|------------------|
| 1 | 11                | 1                |
| 2 | 11                | 2                |
| 3 | 11                | 3                |
| 4 | 12                | 1                |
| 5 | 12                | 2                |
| 6 | 12                | 3                |

Join child and parent table to junction table

|   | parent_name<br>character varying (255) | child_name<br>character varying (255) |
|---|--|---------------------------------------|
| 1 | Homer                                  | Bart                                  |
| 2 | Homer                                  | Lisa                                  |
| 3 | Homer                                  | Maggie                                |
| 4 | Marge                                  | Bart                                  |
| 5 | Marge                                  | Lisa                                  |
| 6 | Marge                                  | Maggie                                |

## **Activity:** Data Relationships

In this activity, you will create table schemata for agents and regions, and then create a junction table to display all regions assigned to agents.

**Suggested Time:**  
10 minutes

**Time's Up!** Let's Review.

Countdown timer

**40:00**

(with alarm)

# Installing SQLAlchemy

---

1. Activate your pyvizenv environment in GitBash (Windows) or Terminal
2. On Windows, Run “pip install pycopg2-binary”
3. Run “conda install -c anaconda sqlalchemy”

# Entity Relationship Diagrams

An **entity relationship diagram**, or **ERD**, is a visual representation of entity relationships within a database.

# ERDs

Entities, their data types, and relationships are all illustrated in the diagram.

# ERDs

---

There are three types of ERDs, or data models, used when creating diagrams:

|            |  |
|------------|--|
| Conceptual | Basic information containing table and column names.                               |
| Logical    | Slightly more complex than a conceptual model, with IDs and data types defined.    |
| Physical   | The blueprint of the database, reflecting physical relationships between entities. |

# ERDs and Quick DBD (Quick Database Diagram)

| Feature              | Conceptual | Logical | Physical |
|----------------------|------------|---------|----------|
| Entity Names         | X          | X       |          |
| Entity Relationships | X          | X       |          |
| Attributes           |            | X       |          |
| Primary Keys         |            | X       |          |
| Foreign Keys         |            | X       |          |
| Table Names          |            |         | X        |
| Column Names         |            |         | X        |
| Column Data Types    |            |         | X        |

## Quick DBD Reference on Relationship Types

```
-      - one TO one
-<     - one TO many
>-     - many TO one
>-<   - many TO many
-0     - one TO zero or one
0-     - zero or one TO one
0-0    - zero or one TO zero or one
-0<    - one TO zero or many
>0-    - zero or many TO one
```

## **Activity:** Designing an ERD, Part 1 and Part 2 (See Part 2 Instructions for FK relationships)

In this activity, you will work with a partner to review the following scenario:

You are meeting with a bank who wants to organize their data in a database.

**Suggested Time:**  
25 minutes

## **Activity:** Designing an ERD, Part 2

In this activity, you will further improve the ERD by creating a physical ERD.

**Suggested Time:**  
10 minutes

**Time's Up!** Let's Review.

**QUESTIONS**

*The  
End*
